POWER to the People

ᐅᒪᖏᐃᔨᔪᐃᔨᓂᐊᓂ ᐊᐃᔨᔾᐠ

Canadians use a great deal of energy, equivalent to nearly 7,500 kg of oil per person annually. We also produce a great deal of energy, adding alternative energy sources and new power storage methods.

Alternative Energy Technology

Alternative energy includes renewable energy that comes from natural, renewable resources such as sunlight, wind, water, and geothermal heat. Use of renewable energy has been increasing around the world. Hydroelectric power leads the way in Canada and other sources are on the rise. Another alternative source of power in Canada is nuclear energy.

Whatever energy sources we use, the metals and minerals of the Earth, along with the people who find and process them, make them possible.
